

For the world to reach its climate protection goals, a sustainable energy source is needed as a storage medium. Hydrogen produced from renewable energy can be this energy source and play a key role in the shift away from fossil fuels.

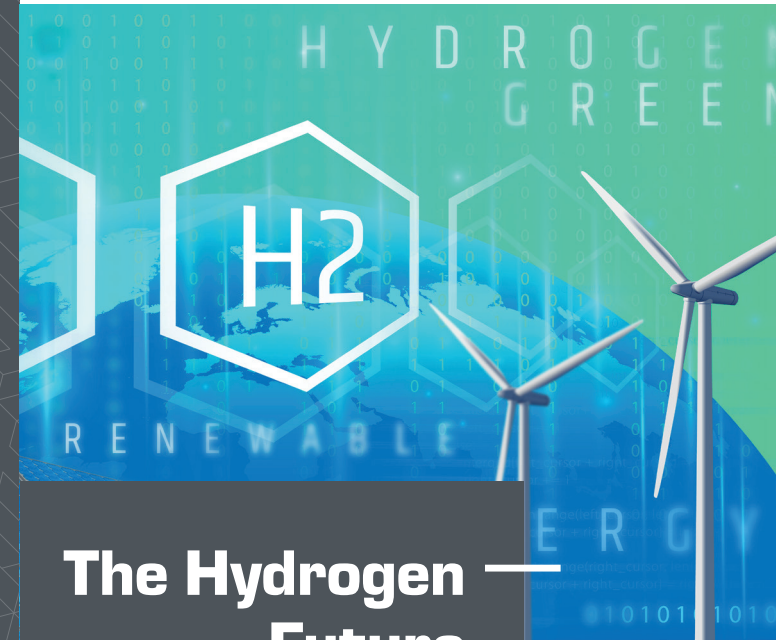

Sector coupling is key to the success of energy revolution. Sector coupling can be understood here as the comprehensive interconnection of all sectors in the energy economy, mobility and industry through linking markets, power grids and the storage and conversion of different forms of energy.

Profit from our decades of experience in diverse industrial sectors and take advantage of our expertise to get your hydrogen project off the ground.
